As of July 2017, the most recent version is AutoCAD 2018. Features Design objects are represented on a planar workspace known as the drawing area. Basic elements such as lines, arcs, and text objects are created by using certain commands and typing commands. The drawing area is built up of layers: a 2-dimensional plane worksheet that has a background color, and a set of objects, typically called blocks, that are in contact with one another. These blocks can be grouped into categories, so that they can be opened and closed in layers with only one layer being visible at a time. A drawing contains symbols, called named objects (Objects) or nonsymbols, that represent physical objects. Symbols, which can also be called parts or components, are represented by geometric objects such as lines, arcs, splines, text, circles, and blocks. The simplest named object is a point (only 1 point) that represents an object that has only 1 dimension: the point's position in space. Complex named objects such as circles, ellipses, and rectangles are built up of components. Each named object, and each of its components, is assigned a name or symbol. Each named object can be associated with a collection of layers, the same way as blocks. For example, a rectangular frame is attached to a drawing with this tool called Layers. An object is created in the drawing area by typing a command followed by a text object name, for example, ZO, or the keyboard shortcut CTRL+Z. By default, the object is created in the layer just beneath the layer where the command is typed. To create the object in a layer above the layer where the command is typed, the use of the parenthesis () is required: (ZO). The parenthesis () are not required if the command is followed by a numerical value, for example, Z3, or when the cursor is above the layer where the command is typed. Editing, transforming, and deleting In addition to the geometric representation of objects, a drawing can be displayed as a wireframe view, where non-geometric objects such as lines and blocks are represented by wires. In AutoCAD, a drawing can be displayed in a block display mode, where each named object is represented by a block, and each block represents multiple geometric objects such as text, arcs, lines, and arcs. Each named object can be edited in a drawing area

Multi-threading - AutoCAD can process multiple, independent threads. This is a capability not present in any other CAD application and was developed by Autodesk. Dynamic toolbars - With AutoCAD, the toolbar is not static, but can change dynamically during the design process. This allows the designer to add or remove functionality as needed. The designer can also change the appearance of the toolbar. AutoCAD can be integrated with a number of systems and networks, including: Websites and web-based applications such as AutoCAD LT Intranet-based applications Embedded systems such as programmable logic controllers Industry-standard TCP/IP protocols, such as Microsoft Windows, MSN, and Novell NetWare Third-party protocols, such as File Transfer Protocol (FTP) Operating systems AutoCAD is supported on Windows, OS/2, OS/400, OS/X, Solaris, Linux, AIX, and UNIX. The United States Congress appropriated only \$50 million to Afghanistan in FY 1999 for health and \$11.6 million for mental health, leaving the bulk of the budget to the individual states. The greatest challenges facing the public sector in Afghanistan are to expand access to health services and supply shortages of equipment, drugs, and diagnostic equipment. The results of the International Monetary Fund's "Priority List" in Afghanistan were disappointing, mainly because the expenditure on social services was kept low. The U.S. Congress appropriated only \$20 million for the humanitarian community in the FY 1999 budget. At the same time, U.S. military leaders are emphasizing the importance of political reconstruction, but the funding for that effort is only \$80 million for the nation as a whole and \$20 million for the United Nations. 5b5f913d15
